

Checklist for Prior Authorization Submission

As with most branded medications, your patient’s health plan may require prior authorization (PA) before it approves Edarbi® (azilsartan medoxomil) or Edarbyclor® (azilsartan medoxomil/chlorthalidone). The checklist below provides basic guidance on what may be needed to obtain a PA decision. It’s important to note that PA requirements will vary among insurers. We encourage health providers to review PA guidelines on the insurer’s website or to contact the insurer’s customer service to confirm requirements, forms, and contacts.

Use of this checklist does not guarantee coverage or that a health plan will provide reimbursement for Edarbi® or Edarbyclor® and is not intended to be a substitute for or to influence the independent medical judgment of the physician.

Completed PA Request Form*:

If required, complete and submit the PA request form to the insurer. PA forms can be obtained through the insurer’s website or by contacting the insurer’s customer service department.

Clinical Documentation such as:

- Diagnosis
- Previously tried and/or failed medication
 - Candesartan Irbesartan Losartan Olmesartan Telmisartan Valsartan
 - Angiotensin II Receptor Antagonist + Hydrochlorothiazide combination
 - Other medication
- Relevant information regarding treatment decision to prescribe Edarbi or Edarbyclor

If the information below is not part of the PA request form, it may be beneficial to provide to the insurer:

- Patient name, date of birth, insurance policy number/member ID and other relevant information
- Physician and facility information (e.g., name, provider ID number and tax ID number)
- Relevant ICD-10 codes:**
 - I10 Essential (primary) hypertension
 - I1A.0 Resistant hypertension
 - I15.9 Secondary hypertension, unspecified

Please scan QR code for Edarbi full Prescribing Information.

Please scan QR code for Edarbyclor full Prescribing Information.

For further safety information please see Important Safety Information on the next page.

For expedited requests, adequate information should be provided to support the urgent nature of the request.

*Specific prior authorization forms may need to be completed for select products or therapeutic areas. Always verify that the correct form has been completed.

INDICATIONS

EDARBI is an angiotensin II receptor blocker (ARB) indicated for the treatment of hypertension in adults, to lower blood pressure and EDARBYCLOR is an angiotensin II receptor blocker (ARB) and a thiazide-like diuretic combination product indicated for the treatment of hypertension to lower blood pressure. EDARBI may be used either alone or in combination with other antihypertensive agents. EDARBYCLOR may be used if a patient is not adequately controlled on monotherapy or as initial therapy if multiple drugs are needed to help achieve blood pressure goals. Lowering blood pressure reduces the risk of fatal and nonfatal cardiovascular events, primarily strokes and myocardial infarctions. There are no controlled trials demonstrating risk reduction with EDARBI or EDARBYCLOR, but trials with chlorthalidone and at least one antihypertensive agent pharmacologically similar to azilsartan medoxomil have demonstrated such benefits. Control of high blood pressure should be part of comprehensive cardiovascular risk management, including, as appropriate, lipid control, diabetes management, antithrombotic therapy, smoking cessation, exercise, and limited sodium intake. Many patients will require more than one drug to achieve blood pressure goals. For specific advice on hypertension goals and management, see published guidelines, such as those of the National High Blood Pressure Education Program's Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC). EDARBI and EDARBYCLOR may be used with other antihypertensive agents.

IMPORTANT SAFETY INFORMATION

WARNING: FETAL TOXICITY

See full Prescribing Information for complete boxed warnings.

- When pregnancy is detected, discontinue EDARBI or EDARBYCLOR as soon as possible.
- Drugs that act directly on the renin-angiotensin system can cause injury and death to the developing fetus.

WARNINGS AND PRECAUTIONS

EDARBYCLOR is contraindicated in patients with anuria.

Do not coadminister aliskiren-containing products with EDARBI or EDARBYCLOR in patients with diabetes.

Fetal Toxicity: EDARBI or EDARBYCLOR can cause fetal harm when administered to a pregnant woman. Use of drugs that act on the renin-angiotensin system during the second and third trimesters of pregnancy reduces fetal renal function and increases fetal and neonatal morbidity and death. Resulting oligohydramnios can be associated with fetal lung hypoplasia and skeletal deformations. Potential neonatal adverse effects include skull hypoplasia, anuria, hypotension, renal failure, and death. When pregnancy is detected, discontinue EDARBI or EDARBYCLOR as soon as possible. Thiazides cross the placental barrier and appear in cord blood and may be associated with adverse reactions, including fetal or neonatal jaundice and thrombocytopenia.

Hypotension in Volume - or Salt-Depleted Patients: In patients with an activated renin-angiotensin system, such as volume- and/or salt-depleted patients (e.g., those being treated with high doses of diuretics), symptomatic hypotension may occur after initiation of treatment with EDARBI or EDARBYCLOR. Such patients are probably not good candidates to start therapy with more than one drug; therefore, correct volume prior to administration of EDARBYCLOR. Correct volume or salt depletion prior to administering EDARBI, or start treatment at 40 mg. If hypotension does occur, the patient should be placed in the supine position and, if necessary, given an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further treatment, which usually can be continued without difficulty once the blood pressure has stabilized.

Impaired Renal Function: Monitor for worsening renal function in patients with renal impairment. Consider withholding or discontinuing EDARBYCLOR if progressive renal impairment becomes evident. As a consequence of inhibiting the renin-angiotensin system, changes in renal function may be anticipated in susceptible individuals treated with EDARBI or EDARBYCLOR. In patients whose renal function may depend on the activity of the renin-angiotensin system (e.g., patients with severe congestive heart failure, renal artery stenosis, or volume depletion), treatment with angiotensin-converting enzyme inhibitors and angiotensin receptor blockers has been associated with oliguria or progressive azotemia and rarely with acute renal failure and death. Similar results may be anticipated in patients treated with EDARBI or EDARBYCLOR. In studies of ACE inhibitors in patients with unilateral or bilateral renal artery stenosis, increases in serum creatinine or blood urea nitrogen have been reported. There has been no long-term use of azilsartan medoxomil in patients with unilateral or bilateral renal artery stenosis, but similar results are expected. In patients with renal disease, chlorthalidone may precipitate azotemia. If progressive renal impairment becomes evident, as indicated by increased blood urea nitrogen, consider withholding or discontinuing diuretic therapy.

Serum Electrolyte Imbalances: Thiazide diuretics can cause hyponatremia and hypokalemia. Drugs that inhibit the renin-angiotensin system can cause hyperkalemia. Hypokalemia is a dose-dependent adverse reaction that may develop with chlorthalidone. Co-administration of digitalis may exacerbate the adverse effects of hypokalemia. Monitor serum electrolytes periodically. EDARBYCLOR attenuates chlorthalidone-associated hypokalemia. In patients with normal potassium levels at baseline, 1.7% of EDARBYCLOR-treated patients, 0.9% of azilsartan medoxomil-treated patients, and 13.4% of chlorthalidone-treated patients shifted to low potassium values (less than 3.4 mmol/L).

Hyperuricemia: Hyperuricemia may occur or frank gout may be precipitated in certain patients receiving chlorthalidone or other thiazide diuretics.

ADVERSE REACTIONS (AEs):

- The most common AE that occurred more frequently with EDARBI than placebo in adults was diarrhea (2% vs 0.5%).
- AEs occurred at an incidence of $\geq 2\%$ of EDARBYCLOR-treated patients and greater than azilsartan medoxomil or chlorthalidone were dizziness (8.9%) and fatigue (2.0%).

The incidence of consecutive increases of creatinine ($\geq 50\%$ from baseline and $>ULN$) was 2.0% in patients treated with the recommended doses of Edarbyclor compared with 0.4% and 0.3% with azilsartan medoxomil and chlorthalidone, respectively.

DRUG INTERACTIONS:

- Monitor renal function periodically in patients receiving EDARBI or EDARBYCLOR and NSAIDs who are also elderly, volume-depleted (including those on diuretics), or who have compromised renal function, as deterioration of renal function, including possible acute renal failure, may result. These effects are usually reversible. NSAIDs may reduce the antihypertensive effect of EDARBI or EDARBYCLOR.
- Dual blockade of the renin-angiotensin system (RAS) with angiotensin receptor blockers, ACE inhibitors, or aliskiren is associated with increased risks of hypotension, hyperkalemia, and changes in renal function (including acute renal failure) compared to monotherapy. In general, avoid combined use of RAS inhibitors. Closely monitor blood pressure, renal function and electrolytes in patients on EDARBI or EDARBYCLOR and other agents that affect the RAS. Do not coadminister aliskiren with EDARBI or EDARBYCLOR in patients with diabetes or renal impairment (GFR <60 mL/min).
- Renal clearance of lithium is reduced by diuretics, such as chlorthalidone, increasing the risk of lithium toxicity. Increases in serum lithium concentrations and lithium toxicity have been reported during concomitant administration of lithium with angiotensin II receptor agonists. Monitor serum lithium levels during concomitant use.

The Important Safety Information does not include all the information needed to use [EDARBI](#) and [EDARBYCLOR](#) safely and effectively.

For further information, please see accompanying complete Prescribing Information for [EDARBI](#) and [EDARBYCLOR](#).
